

PATHOLOGY REPORT

ARISE • Synthetic conflicting-evidence demo input

Patient ID	SYN-PT-0814	Case ID	ARISE-CONFLICT-01
Age / Sex	48 / Female	Study Date	25 Sep 2026
Lesion	Left breast, upper outer quadrant	Comparison	No prior study available

CLINICAL HISTORY

Core biopsy obtained from the same left breast mass described in the accompanying radiology report.

GROSS DESCRIPTION

Multiple tan-white tissue cores, ranging from 0.5 to 1.3 cm, received in formalin and entirely submitted.

MICROSCOPIC DESCRIPTION

Sections show benign breast tissue with cystically dilated ducts, apocrine metaplasia, stromal fibrosis, and usual ductal hyperplasia. No invasive carcinoma is identified in the sampled tissue.

IMMUNOHISTOCHEMISTRY

E-cadherin staining is retained in the epithelial proliferation. Findings support a benign proliferative process in the sampled material.

PATHOLOGY IMPRESSION

Benign breast tissue with fibrocystic change and usual ductal hyperplasia. No malignancy identified in the submitted biopsy.

COMMENT

The benign pathology result should be correlated with imaging findings. If there is radiologic-pathologic discordance, repeat sampling or additional evaluation may be considered by the treating clinical team.

DEMO DATA NOTICE: This is synthetic fictional data created for the ARISE hackathon prototype. It is not a real patient record and is not for clinical use.
